Primary Use/Purpose: This section describes what this instrument was designed to measure.

The Racialized Sexual Harassment Scale (RSHS; Buchanan, 2005) is a 21-item survey that measures experiences of racial harassment, sexual harassment, and a combination of both, called racialized sexual harassment (RSH). Respondents are asked about harassing behaviors they may have experienced during the past twelve months at school (e.g. “said things to insult people of your gender (for example, saying women/men aren’t good at a particular job)”, “made comments about your body that emphasized your gender and ethnicity (for example, for Black women, comments about one’s ‘Black ass’). For each behavior, they are asked if it occurred because of their ethnicity, because of their gender, or because of their ethnicity and gender. Responses are on a 5-point scale ranging from 0 (never) to 4 (many times), where greater scores correspond to more experiences of harassment.

Background and Development: How and why this instrument was developed.

Initially, the measure repeated the same question asking first they experienced that type of behavior based on gender, then ethnicity, and then gender AND ethnicity (RSH). This allowed us to isolate RSH as a separate, although related, phenomenon and compare its psychometric properties to sexual harassment and racial harassment. Some subsequent studies have used only the RSH subscale. The subscale functions well on its own and can be used without the racial or sexual harassment subscales depending on the purpose of a given study.
The items reported below were from a study of college students. As such, the stem asks about experiences they had within the past 12 months within the college environment. Other studies of working adults or high school students have varied the stem to focus on experiences in high school or their workplace. These variations to the scale do not change the integrity of the measure and appear to work equally well.

**Psychometrics (if applicable):** Any testing of this instrument.

Buchan reports the RSHS has a reliability coefficient of .86 and syntax for this calculation, as well as factor analysis, is included.

**Link to Instrument:** Link to the instrument if available.

**Submitted by:** Nicole Buchanan submitted this instrument to the CVR Instruments Collection and certified permission to publicly share this instrument.
Racialized Sexual Harassment Scale:

The Racialized Sexual Harassment Scale (RSHS; Buchanan, 2005, 2016) is a 21-item survey that measures experiences of racial harassment, sexual harassment, and a combination of both, called racialized sexual harassment (RSH). Respondents are asked about harassing behaviors they may have experienced during the past twelve months at school (e.g. “said things to insult people of your gender (for example, saying women/men aren’t good at a particular job)”, “made comments about your body that emphasized your gender and ethnicity (for example, for Black women, comments about one’s ‘Black ass’)”). For each behavior, they are asked if it occurred because of their ethnicity, because of their gender, or because of their ethnicity and gender. Responses are on a 5-point scale ranging from 0 (never) to 4 (many times), where greater scores correspond to more experiences of harassment. Buchanan (2005) reported the RSHS reliability coefficient to be .86.

SPSS syntax is provided below from our College Experiences Survey. For this study, three different scales were created: rhtot, shtot, and rshtot. The “rhtot” scale reflects the total number and frequency of racial harassment items a participant endorsed, where higher scores indicated more frequent experiences of racial harassment. The “shtot” scale reflects the total number and frequency of sexual harassment items endorsed, while the “rshtot” scale reflects the total number and frequency of racialized sexual harassment items endorsed.

Variations in scale use:

Initially, the measure repeated the same question asking first they experienced that type of behavior based on gender, then ethnicity, and then gender AND ethnicity (RSH). This allowed us to isolate RSH as a separate, although related, phenomenon and compare its psychometric properties to sexual harassment and racial harassment. Some subsequent studies have used only the RSH subscale. The subscale functions well on its own and can be used without the racial or sexual harassment subscales depending on the purpose of a given study.

The items reported below were from a study of college students. As such, the stem asks about experiences they had within the past 12 months within the college environment. Other studies of working adults or high school students have varied the stem to focus on experiences in high school or their workplace. These variations to the scale do not change the integrity of the measure and appear to work equally well.

**Additional readings on racialized sexual harassment:**

*Please note that these readings are available from ResearchGate or by contacting me at nbuchana@msu.edu. [https://www.researchgate.net/profile/Nicole_Buchanan](https://www.researchgate.net/profile/Nicole_Buchanan)*

**Terms of use:**

I welcome widespread use of the scale with proper citation. I also request that you send me feedback on the scale (e.g. reliability statistic and sample information) and let me know about your papers (thesis, dissertations, chapters, and manuscripts, published or unpublished) that use the scale.

**Racialized Sexual Harassment Scale items:**

During the time that you have attended your school, were you ever in a situation in which any of your teachers, classmates, advisors, students, or staff:
